TITLE OF INVENTION

ANTAGONISTS SPECIFIC FOR THE CORTICOTROPIN-RELEASING FACTOR RECEPTOR TYPE 2 (CRFR2)

APPLICANT(S) FOR DO/EO/US

SPIESS, Joachim; RUHMANN, Andreas

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39 (1).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☐ is transmitted herewith (required only if not transmitted by the International Bureau).
 - b. ☒ has been transmitted by the International Bureau. WO 00/05253
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ A translation of the International Application into English (35 U.S.C. 371(c)(3)).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(2)).
 - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
 - b. ☐ have been transmitted by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☒ have not been made and will not be made.
8. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11. to 16. below concern document(s) or information included:

11. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.-1449 and International Search Report (PCT/ISA/210)
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A FIRST preliminary amendment.
☐ A SECOND or SUBSEQUENT preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☒ Other items or information:
 - 1.) PCT Request (PCT/RO/101)
 - 2.) International Preliminary Examination Report (PCT/IPEA/409)
 - 3.) Four (4) sheets of Formal Drawings

Filed: January 24, 2001 Examiner:
For: ANTAGONISTS SPECIFIC FOR THE CORTICOTROPIN-
RELEASING FACTOR RECEPTOR TYPE 2 (CRFR2)

PRELIMINARY AMENDMENT

BOX PATENT APPLICATION

Assistant Commissioner for Patents
Washington, DC 20231

January 24, 2001

Sir:.

The following Preliminary Amendments and Remarks are respectfully submitted in connection with the above-identified application.

AMENDMENTS

IN THE SPECIFICATION:

Please amend the specification as follows:

Before line 1, insert --This application is the national phase under 35 U.S.C. § 371 of PCT International Application No. PCT/EP99/05297 which has an International filing date of July 23, 1999, which designated the United States of America.--

IN THE CLAIMS:

Please amend the claims as follows:

Claim 8: Line 1, change "any one of claims 3, 4, or 6" to --claim 3--

Claim 11: Line 1, change "any one of claims 5,7,9 or 10" to --claim 5--

Claim 13: Line 1, change "any one of claims 7,10 or 12" to --claim 7--

Claim 17: Line 1, change "any one of claims 14 to 16" to --claim 14--

Claim 19: Lines 1 to 2, change "any one of claims 1 to 7, 11, 13 or 14 to 16" to --claim 1--

Claim 22: Line 1, delete "or 21"

Claim 23: Lines 1 to 2, delete "any one of claims 1 to 7, 11, 13, or 14 to 16"

Claim 25: Line 1, change "any one of claims 1 to 18, or 24" to --claim 1--

Claim 27: Lines 1 to 2, change "any one of claims 1 to 18, or 24" to --claim 1--; and

Line 2, delete "or 21"

Claim 28: Lines 1 to 2, change "any one of claims 1 to 18, or 24" to --claim 1--; and

Line 2, delete "or 21"

Claim 19: Line 2, change "any one of claims 1 to 18, or 24" to --claim 1--; and

Line 4, delete "or 21"

Claim 30: Line 1, change "any one of claims 1 to 18, or 24" to --claim 1--; and

Line 2, delete "or 21"

Claim 31: Line 1, change "any one of claims 1 to 18, or 24, or the use of claim 30" to --claim 1--

Claim 32: Line 1, delete "or 31"

Claim 33: Line 1, change "any one of claims 1 to 18,
or 24" to --claim 1--; and

Line 2, delete "or 21"

REMARKS

The specification has been amended to provide a cross-reference to the previously filed International Application. The claims have also been amended to delete improper multiple dependents and to place the application into better form for examination. Entry of the present amendment and favorable action on the above-identified application are respectfully requested.

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 02-2448 for any additional fees required under 37 C.F.R. § 1.16 or under 37 C.F.R. § 1.17; particularly, extension of time fees.

Respectfully submitted,

BIRCH, STEWART, KOLASCH & BIRCH, LLP

Antagonists specific for the corticotropin-releasing factor receptor
type 2 (CRFR2)

TE 56 444444

The present invention relates to an antagonist of the ligand of the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 8 to 10 N-terminal amino acids of native sauvagine. The present invention also relates to an antagonist of the ligand of the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 11 N-terminal amino acids of native sauvagine, wherein the N-terminal amino acid of said antagonist is a charged amino acid. Furthermore, the present invention relates to a polynucleotide encoding the antagonist of the present invention, a vector comprising the polynucleotide of the present invention, and a host comprising the polynucleotide or vector of the present invention. Also described are a method for producing the antagonist of the present invention, antibodies directed against the antagonist of the present invention, as well as anti-idiotypic antibodies directed against the antibody of the present invention. The present invention also relates to pharmaceutical and diagnostic compositions comprising the antagonist, the polynucleotide, the vector, the antibody, and/or the anti-idiotypic antibody of the present invention. Furthermore, the present invention relates to a kit comprising one or more of the above mentioned compounds of the present invention and to the use of one or more of these compounds for the preparation of a pharmaceutical composition for preventing and/or treating a Corticotropin-Releasing Factor Receptor, type 2 (CRFR2)-associated disease.

Corticotropin-releasing factor (CRF), believed to synchronize the endocrine, autonomic, immunologic and behavioral responses to stress, was characterized as a 41-residue polypeptide (Spiess, J., J. Rivier, C. Rivier, and W. Vale, *Proc. Natl. Acad. Sci. USA* **78**:6517-6521, 1981) on the basis of its ability to stimulate the secretion of adrenocorticotrophic hormone (ACTH) from the anterior pituitary (Vale, W., J. Spiess, C. Rivier, and J. Rivier, *Science* **213**:1394-1397, 1981).

CRF exhibits its activity through G protein-coupled receptors. CRF receptor, type 1 (CRFR1), mainly found in pituitary and brain was cloned from human, mouse, rat, chicken, and frog (Vita, N., P. Laurent, S. Lefort, P. Chalon, J.-M. Lelias, M. Kaghad, G. Le Fur, D. Caput, and P. Ferrara, *FEBS Lett.* **335**:1-5, 1993; Chen, R., K. A. Lewis, M. H. Perrin, and W. Vale, *Proc. Natl. Acad. Sci. USA* **90**:8967-8971, 1993; Perrin, M. H., C. J. Donaldson, R. Chen, K. A. Lewis, and W. Vale, *Endocrinology* **133**:3058-3061, 1993; Chang, C.-P., R. V. Pearse II, S. O'Connell, and M. G. Rosenfeld, *Neuron* **11**:1187-1195, 1993; Yu, J., L. Y. Xie, and A. B. Abou-Samra, *Endocrinology* **137**:192-197, 1996; Dautzenberg, F. M., K. Dietrich, M. R. Palchaudhuri, and J. Spiess, *J. Neurochem.* **69**:1640-1649, 1997). cDNAs coding for two splice variants of CRF receptor, type 2, CRFR2 α and CRFR2 β , were cloned from brain, heart, and skeletal muscle (Lovenberg, T. W., C. W. Liaw, D. E. Grigoriadis, W. Clevenger, D. T. Chalmers, E. B. De Souza, and T. Oltersdorf, *Proc. Natl. Acad. Sci. USA* **92**:836-840, 1995; Perrin, M., C. Donaldson, R. Chen, A. Blount, T. Berggren, L. Bilezikjian, P. Sawchenko, and W. Vale, *Proc. Natl. Acad. Sci. USA* **92**:2969-2973, 1995; Kishimoto, T., R. V. Pearse II, C. R. Lin, and M. G. Rosenfeld, *Proc. Natl. Acad. Sci. USA* **92**:1108-1112, 1995; Stenzel, P., R. Kesterson, W. Yeung, R. D. Cone, M. B. Rittenberg, and M. P. Stenzel-Poore, *Mol. Endocrinol.* **9**:637-645, 1995). In rodents, CRFR2 α has been exclusively found in the central nervous system (CNS), whereas CRFR2 β is predominantly distributed in the periphery. In humans, both receptor subtypes have been found in the CNS (Valdenaire, O., T. Giller, V. Breu, J. Gottowik, and G. Kilpatrick, *Biochim. Biophys. Acta* **1352**: 129-132, 1997). Recently, it has been proposed that urocortin (Ucn), a natural CRF analog, is the endogenous ligand to CRFR2 (Vaughan, J., C. Donaldson, J. Bittencourt, M. H. Perrin, K. Lewis, S. Sutton, R. Chan, A. V. Turnbull, D. Lovejoy, C. Rivier, J. Rivier, P. E. Sawchenko, and W. Vale, *Nature (London)* **378**:287-292, 1995).

CRF is assumed to play a major role in a number of neuropsychiatric diseases including affective disorders, anxiety disorders, anorexia nervosa and Alzheimer's disease (Behan, D. P., S. C. Heinrichs, J. C. Troncoso, X. J. Liu, C. H. Kawas, N. Ling, and E. B. De Souza, *Nature (London)* **378**:284-287, 1995). There is substantial interest in the design and synthesis of CRF antagonists acting selectively at one of the different CRF forms. After the discovery of potent peptide antagonists based on the N-terminally truncated amino acid sequence of human/rat CRF (h/rCRF) (Rivier, J., C.

Rivier, R. Galyean, A. Miranda, C. Miller, A. G. Craig, G. Yamamoto, M. Brown, and W. Vale, *J. Med. Chem.* **36**:2851-2859, 1993; Hernandez, J. F., W. Kornreich, C. Rivier, A. Miranda, G. Yamamoto, J. Andrews, Y. Tache, W. Vale, and J. Rivier, *J. Med. Chem.* **36**:2860-2867, 1993; Miranda, A., S. C. Koerber, J. Gulyas, S. L. Lahrichi, A. G. Craig, A. Corrigan, A. Hagler, C. Rivier, and J. Rivier, *J. Med. Chem.* **37**:1450-1459, 1994; Gulyas, J., C. Rivier, M. Perrin, S. C. Koerber, S. Sutton, A. Corrigan, S. L. Lahrichi, A. G. Craig, W. Vale, and J. Rivier, *Proc. Natl. Acad. Sci. USA* **92**:10575-10579, 1995; Miranda, A., S. L. Lahrichi, J. Gulyas, S. C. Koerber, A. G. Craig, A. Corrigan, C. Rivier, W. Vale, and J. Rivier, *J. Med. Chem.* **40**:3651-3658, 1997), several CRFR1-selective nonpeptidic antagonists have been developed (Chen, C., R. Dagnino, Jr., E. B. De Souza, D. E. Grigoriadis, C. Q. Huang, Kjung-Il Kim, Z. Liu, T. Moran, T. R. Webb, J. P. Whitten, Y. F. Xie, and J. R. McCarthy, *J. Med. Chem.* **39**:4358-4360, 1996; Schulz, D. W., R. S. Mansbach, J. Sprouse, J. P. Braselton, J. Collins, M. Corman, A. Dunaiskis, S. Faraci, A. W. Schmidt, T. Seeger, P. Seymour, F. D. Tingley III, E. N. Winston, Y. L. Chen, and J. Heym, *Proc. Natl. Acad. Sci. USA* **93**:10477-10482, 1996; Christos, T. E., and A. Arvanitis, *Expert Opinion On Therapeutic Patents* **8**: 143-152, 1998) which attenuate CRF-mediated seizure (Baram, T. Z., D. T. Chalmers, C. Chen, Y. Koutsoukos, and E. B. De Souza, *Brain Research* **770**: 89-95, 1997) or interleukin-1 β -induced fever or exhibit anxiolytic activity *in vivo* (Lundkvist, J., Z. Chai, R. Teheranian, H. Hasanvan, T. Bartfai, F. Jenck, U. Widmer, and J.-L. Moreau, *Eur. J. Pharmacol.* **309**: 195-200, 1996). However, the fact that CRF antagonist α -helical CRF₍₉₋₄₁₎ exhibits different inhibitory potencies in three different *in vivo* bioassay systems (Fisher, L., C. Rivier, J. Rivier, and M. Brown, *Endocrinology* **129**:1312-1316, 1991) suggests that distinct physiological functions of endogenous CRF or Ucn are mediated via CRFR1, CRFR2 or both receptor types.

Thus, the technical problem underlying the present invention was to develop CRFR2-specific antagonists to permit discrimination between receptor type-specific functions, e.g., in the brain and peripheral organs.

The solution to said technical problem is provided by the embodiments characterized in the claims.

Accordingly, the present invention relates to an antagonist of the ligand of the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 8 to 10 N-terminal amino acids of native sauvagine.

In accordance with the present invention the term "ligand" encompasses any molecule capable of specifically binding to the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2), including, e.g., (the) naturally occurring, endogenous ligand(s) of CRFR2, or any compound(s) recombinantly or chemically synthesized or biochemically modified and capable of binding and activating CRFR2.

The term "CRFR2-specific", "CRFR2-selective", "CRFR2-specificity" or "CRFR2-selectivity" as used in accordance with the present invention denotes a value which is higher than 30, preferably higher than 45, and more preferred higher than 70, and calculated according to the equation mentioned in the legend to table 1. Thus, as used in accordance with the present invention, e.g., a "CRFR2-specific" antagonist is not meant to exclusively bind to CRFR2, but to bind to CRFR2 with an at least 30-fold, preferably 45-fold, and more preferred 70-fold higher selectivity than astressin, which exhibits a similar affinity for CRFR1 and CRFR2, in particular CRFR2 β .

Studies which have been carried out in accordance with the present invention surprisingly revealed that deletion of the 8 to 10 N-terminal amino acids of native sauvagine, which is a potent non-selective activator of CRFR, renders this compound a highly specific antagonist for CRFR2.

In a preferred embodiment the antagonist of the present invention lacks the 10 N-terminal amino acids of native sauvagine.

In a more preferred embodiment the antagonist of the present invention comprises the amino acid sequence Xaa₁-Xaa₂-Leu-Leu-Arg-Lys-Met-Ile-Glu-Ile-Glu-Lys-Gln-Glu-Lys-Glu-Lys-Gln-Gln-Ala-Ala-Asn-Asn-Arg-Leu-Leu-Leu-Asp-Thr-Ile-NH₂, wherein Xaa₁ is a neutral amino acid, and Xaa₂ is a charged amino acid.

In another more preferred embodiment of the antagonist of the present invention, Xaa₁ is a hydrophobic amino acid, and Xaa₂ is Glu or His.

In an even more preferred embodiment of the antagonist of the present invention Xaa₁ is Leu.

In a further more preferred embodiment, Xaa₁ is a polar amino acid and Xaa₂ is Glu or His.

In a still more preferred embodiment of the antagonist of the present invention Xaa₁ is Tyr.

It is envisaged that antagonists of the present invention comprising Tyr as the N-terminal amino acid can be advantageously used to be radioactively labelled with, e.g., ¹²⁵I. Such compounds may then be employed in in vivo or in vitro experiments for the detection of CRFR2 binding sites. Although antagonists ¹²⁵I-labelled via His are also encompassed by the present invention, antagonists labelled via Tyr are preferred because the labelling reaction is easier to perform from the technical point of view, and the labelled compound is more stable and, therefore, easier to handle.

In a further even more preferred embodiment of the antagonist of the present invention Xaa₁ is in the D-configuration.

In a further still more preferred embodiment of the antagonist of the present invention Xaa₁ is D-Leu or D-Tyr.

In a most preferred embodiment of the antagonist of the present invention Xaa₂ is Glu.

In another still more preferred embodiment of the antagonist of the present invention Xaa₁ is D-Phe.

In another most preferred embodiment of the antagonist of the present invention Xaa₂ is His.

In another embodiment, the present invention relates to an antagonist of the ligand of

the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 11 N-terminal amino acids of native sauvagine, wherein the N-terminal amino acid of said antagonist is a charged amino acid.

In a preferred embodiment, said charged amino acid is positively charged.

In a more preferred embodiment, said charged amino acid is His.

In another preferred embodiment, the antagonist of the present invention comprises a phenyldiazirine group coupled to the N-terminal amino acid of said antagonist.

Antagonists of the present invention comprising a phenyldiazirine group are envisaged to be used, e.g., in photoaffinity labelling experiments. Accordingly, these compounds can be advantageously used to characterize antagonistic binding sites of CRFR2 β receptor systems.

In a more preferred embodiment, said phenyldiazirine group is a 4-(1-azi-2,2,2-trifluoroethyl)benzoyl (ATB)-group.

In a further embodiment the present invention relates to a polynucleotide encoding the antagonist of the present invention.

The polynucleotide of the present invention may be, e.g., DNA, cDNA, RNA or synthetically produced DNA or RNA or a recombinantly produced chimeric nucleic acid molecule comprising any of those polynucleotides either alone or in combination.

In another embodiment the present invention relates to a vector comprising the polynucleotide of the present invention.

The vector of the present invention may be, e.g., a plasmid, cosmid, virus, bacteriophage or another vector used conventionally in genetic engineering, and may comprise further genes such as marker genes which allow for the selection of said

vector in a suitable host cell and under suitable conditions.

In a preferred embodiment of the vector of the present invention the polynucleotide is operatively linked to an expression control sequence.

Said expression control sequence allows expression in prokaryotic or eukaryotic cells. Expression of said polynucleotide comprises transcription of the polynucleotide into a translatable mRNA. Regulatory elements ensuring expression in eukaryotic cells, preferably mammalian cells, are well known to those skilled in the art. They usually comprise regulatory sequences ensuring initiation of transcription and optionally poly-A signals ensuring termination of transcription and stabilization of the transcript. Additional regulatory elements may include transcriptional as well as translational enhancers, and/or naturally-associated or heterologous promoter regions.

Possible regulatory elements permitting expression in prokaryotic host cells comprise, e.g., the PL, lac, trp or tac promoter in *E. coli*, and examples for regulatory elements permitting expression in eukaryotic host cells are the AOX1 or GAL1 promoter in yeast or the CMV-, SV40-, RSV-promoter (Rous sarcoma virus), CMV-enhancer, SV40-enhancer or a globin intron in mammalian and other animal cells. Beside elements which are responsible for the initiation of transcription such regulatory elements may also comprise transcription termination signals, such as the SV40-poly-A site or the tk-poly-A site, downstream of the polynucleotide. Furthermore, depending on the expression system used leader sequences capable of directing the polypeptide to a cellular compartment or secreting it into the medium may be added to the coding sequence of the polynucleotide of the invention and are well known in the art. The leader sequence(s) is (are) assembled in appropriate phase with translation, initiation and termination sequences, and preferably, a leader sequence capable of directing secretion of translated protein, or a portion thereof, into the periplasmic space or extracellular medium. Optionally, the heterologous sequence can encode a fusion protein including an C- or N-terminal identification peptide imparting desired characteristics, e.g., stabilization or simplified purification of expressed recombinant product. In this context, suitable expression vectors are known in the art such as Okayama-Berg cDNA expression vector pcDV1 (Pharmacia), pCDM8, pRc/CMV, pcDNA1, pcDNA3 (In-vitrogene), or pSPORT1

(GIBCO BRL).

Preferably, the expression control sequences will be eukaryotic promoter systems in vectors capable of transforming or transfecting eukaryotic host cells, but control sequences for prokaryotic hosts may also be used. Once the vector has been incorporated into the appropriate host, the host is maintained under conditions suitable for high level expression of the nucleotide sequences.

Furthermore, the present invention relates to a host comprising the polynucleotide or vector of the present invention.

Said host may be a prokaryotic or eukaryotic cell. The polynucleotide or vector of the invention which is present in the host cell may either be integrated into the genome of the host cell or it may be maintained extrachromosomally.

The host cell can be any prokaryotic or eukaryotic cell, such as a bacterial, insect, fungal, plant, animal or human cell. Preferred fungal cells are, for example, those of the genus *Saccharomyces*, in particular those of the species *S. cerevisiae*. The term "prokaryotic" is meant to include all bacteria which can be transformed or transfected with a polynucleotide or vector of the present invention for the expression of the antagonist of the present invention. Prokaryotic hosts may include gram negative as well as gram positive bacteria such as, for example, *E. coli*, *S. typhimurium*, *Serratia marcescens* and *Bacillus subtilis*. The term "eukaryotic" is meant to include yeast, higher plant, insect and preferably mammalian cells. Depending upon the host employed in a recombinant production procedure, the antagonist encoded by the polynucleotide of the present invention may or may not be post-translationally modified. A polynucleotide of the invention can be used to transform or transfect the host using any of the techniques commonly known to those of ordinary skill in the art. Furthermore, methods for preparing fused, operably linked genes and expressing them in, e.g., mammalian cells and bacteria are well-known in the art (e.g. Sambrook et al., *Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory, Cold Spring Harbor, NY, 1989). The genetic constructs and methods described therein can be utilized for expression of the antagonist of the present invention in eukaryotic or prokaryotic hosts. In general, expression vectors containing promoter sequences which facilitate the efficient transcription of the inserted polynucleotide are used in connection with the host. The expression vector typically contains an origin of

replication, a promoter, and a terminator, as well as specific genes which are capable of providing phenotypic selection of the transformed cells. Furthermore, transgenic animals, preferably mammals, comprising host cells of the invention may be used for the large scale production of the antagonist of the present invention.

The present invention also relates to a method for producing the antagonist of the present invention, said method comprising culturing the host of the present invention under conditions that cause the synthesis of said antagonist, and recovering said antagonist from the culture.

Depending on the specific construct and condition used, the antagonist may be recovered from the host cells, from the culture medium or from both.

The present invention further relates to an antagonist obtainable by the method of the present invention.

Alternatively, the antagonist of the present invention can be chemically synthesized according to methods well known in the art, e.g., solid phase synthesis with Fmoc or t-boc chemistry (see also , e.g., Rühmann, A., A. K. E. Köpke, F. M. Dautzenberg, and J. Spiess, *Proc. Natl. Acad. Sci. USA* **93**:10609-10613, 1996).

In another embodiment the present invention relates to an antibody directed against the antagonist of the present invention.

In a further embodiment the present invention relates to an anti-idiotypic antibody directed against the antibody of the present invention.

The antibodies of the present invention may be monoclonal antibodies, polyclonal antibodies, single chain antibodies, humanized antibodies, or fragments thereof that specifically bind the antagonist of the present invention or the antibody directed against the antagonist of the present invention. Bispecific antibodies, synthetic antibodies, antibody fragments, such as Fab, Fv or scFv fragments etc., or chemically modified derivatives of any of these are also encompassed by the present invention. Monoclonal antibodies can be prepared, for example, by the techniques as originally described in Köhler and Milstein, *Nature* **256** (1975), 495, and Galfré, *Meth. Enzymol.*

73 (1981), 3, which comprise the fusion of mouse myeloma cells to spleen cells derived from immunized mammals with modifications developed by the art. Furthermore, antibodies or fragments thereof can be obtained by using methods which are described, e.g., in Harlow and Lane "Antibodies, A Laboratory Manual", CSH Press, Cold Spring Harbor, 1988. The production of chimeric antibodies is described, for example, in WO89/09622. Methods for the production of humanized antibodies are described in, e.g., EP-A1 0 239 400 and WO90/07861. A further source of antibodies to be utilized in accordance with the present invention are so-called xenogenic antibodies. The general principle for the production of xenogenic antibodies such as human antibodies in mice is described in, e.g., WO 91/10741, WO 94/02602, WO 96/34096 and WO 96/33735. As discussed above, the antibodies of the invention may exist in a variety of forms besides complete antibodies; including, for example, Fv, Fab and F(ab)2, as well as in single chains; see e.g. WO88/09344.

The present invention also relates to a pharmaceutical composition comprising the antagonist, the polynucleotide, the vector, the antibody and/or the anti-idiotypic antibody of the present invention and optionally a pharmaceutically acceptable carrier and/or diluent.

Examples of suitable pharmaceutical carriers are well known in the art and include phosphate buffered saline solutions, water, emulsions, such as oil/water emulsions, various types of wetting agents, sterile solutions etc. Compositions comprising such carriers can be formulated by well known conventional methods. These pharmaceutical compositions can be administered to the subject at a suitable dose. Administration of the suitable compositions may be effected by different ways, e.g., by intravenous, intraperitoneal, subcutaneous, intramuscular, topical or intradermal administration. The dosage regimen will be determined by the attending physician and clinical factors. As is well known in the medical arts, dosages for any one patient depends upon many factors, including the patient's size, body surface area, age, the particular compound to be administered, sex, time and route of administration, general health, and other drugs being administered concurrently. The compositions of the invention may be administered locally or systemically. Preparations for parenteral administration include sterile aqueous or non-aqueous solutions, suspensions, and emulsions. Examples of non-aqueous solvents are propylene

glycol, polyethylene glycol, vegetable oils such as olive oil, and injectable organic esters such as ethyl oleate. Aqueous carriers include water, alcoholic/aqueous solutions, emulsions or suspensions, including saline and buffered media. Parenteral vehicles include sodium chloride solution, Ringer's dextrose, dextrose and sodium chloride, lactated Ringer's, or fixed oils. Intravenous vehicles include fluid and nutrient replenishers, electrolyte replenishers (such as those based on Ringer's dextrose), and the like. Preservatives and other additives may also be present such as, for example, antimicrobials, anti-oxidants, chelating agents, and inert gases and the like. Furthermore, the pharmaceutical composition of the invention may comprise further agents depending on the intended use of the pharmaceutical composition.

Furthermore, the present invention relates to a diagnostic composition comprising the antagonist, the polynucleotide, the vector, the antibody and/or the anti-idiotypic antibody of the present invention.

The present invention further relates to a kit comprising the antagonist, the polynucleotide, the vector, the antibody and/or the anti-idiotypic antibody of the present invention.

The components of the diagnostic composition and/or the kit of the invention may be packaged in containers such as vials, optionally in buffers and/or solutions. If appropriate, one or more of said components may be packaged in one and the same container. Additionally or alternatively, one or more of said components may be adsorbed to solid support such as, e.g., a nitrocellulose filter or nylon membrane, or to the well of a microtiter plate.

In another embodiment the present invention relates to the use of the antagonist, the polynucleotide, the vector, the antibody and/or the anti-idiotypic antibody of the present invention for the preparation of a pharmaceutical composition for preventing and/or treating a Corticotropin-Releasing Factor Receptor, type 2 (CRFR2)-associated disease.

In a preferred embodiment of the antagonist or the use of the present invention said CRFR2 is CRFR2 α or CRFR2 β .

In another preferred embodiment the use of the present invention is for preventing and/or treating affective disorders, gastric intestinal diseases, cardiopathic diseases, psychiatric diseases, preferably eating disorders, anxiety disorders or anorexia nervosa, and/or Alzheimer's disease.

The present invention also relates to the use of the antagonist, the polynucleotide, the vector, the antibody and/or the anti-idiotypic antibody of the present invention for the investigation of CRF receptor type-specific functions.

The documents cited herein are herewith incorporated by reference.

Abbreviations used throughout the description, the figure legends, and the examples are as follows: IUPAC rules are used for the nomenclature of peptides including one letter codes for amino acids. AAA: amino acid analysis; ACTH: adrenocorticotrophic hormone; ANOVA: one-way analysis of variance; astressin: {cyclo(30-33)[DPhe¹², Nle^{21,38}, Glu³⁰, Lys³³]h/rCRF_{(12-41)}}; BSA: bovine serum albumin; cAMP: adenosine 3', 5'-cyclic monophosphate; CRF: corticotropin-releasing factor (h = human, o = ovine, r = rat); CRFR: CRF receptor; DIEA: *N,N*-diisopropylethylamine; DMF: dimethylformamide; Fmoc: 9-fluorenylmethoxycarbonyl; HBTU: *O*-(benzotriazol-1-yl)-*N,N,N',N'*-tetramethyluronium hexafluorophosphate; HEK: human embryonic kidney; HOAc: acetic acid; HOBt: 1-hydroxybenzotriazole; ¹²⁵I: ¹²⁵I-iodinated; MeCN: acetonitrile; MS: mass spectrometry; NMP: *N*-methylpyrrolidone-2; OAl: *O*-allyl; OAlloc: *O*-allyloxycarbonyl; Pd⁰[PPh₃]₄: tetrakis-(triphenylphosphine)-palladium; RP-HPLC: reverse phase high-performance liquid chromatography; SAR: structure-activity relationship; Svg: sauvagine; TFA: trifluoroacetic acid; Ucn: urocortin.

The figures show:

Figure 1:

Comparison of the amino acid sequence of human/rat corticotropin-releasing factor (h/rCRF) with ovine corticotropin-releasing factor (oCRF), rat urocortin (rUcn), sauvagine (Svg), and astressin. Identical amino acids are shaded.

Figure 2:

Chemical cross-linking of [125 I-Tyr 0]oCRF or [125 I-Tyr 0]Svg to membrane homogenates of human embryonic kidney (HEK) 293 cells stably transfected with cDNA coding for rat CRF receptor, type 1 (rCRFR1) (lanes 1 and 2) or mouse CRF receptor, type 2 β (mCRFR2 β) (lanes 3 and 4), respectively. Fifty μ g of total membrane protein was labeled with approximately 100,000 cpm of [125 I-Tyr 0]oCRF (lanes 1 and 2) and [125 I-Tyr 0]Svg (lanes 3 and 4), and incubated (37°C, 30 min) in the presence (lane 2 and 4) or absence (lane 1 and 3) of 2000 units PNGase.

Figure 3:

Displacement of [125 I-Tyr 0]oCRF (A) or [125 I-Tyr 0]Svg (B) bound to membrane homogenates of HEK 293 cells stably transfected with cDNA coding for rat CRF receptor, type 1 (rCRFR1) (A), or mouse CRF receptor, type 2 β (mCRFR2 β) (B), by oCRF (compound 1, \circ), Svg (compound 2, \square), astressin (compound 3, Δ), [DPhe 12 , Nle 21,38]h/rCRF $_{(12-41)}$ (compound 5, \blacktriangle), [DPhe 12]oCRF $_{(12-41)}$ (compound 6, \bullet), [DPhe 11]rUcn $_{(11-40)}$ (compound 7, \blacklozenge), and [DPhe 11 , His 12]Svg $_{(11-40)}$ (compound 11, \blacksquare). The error bars represent the SEM and are not shown when smaller than the symbol size.

Figure 4:

Potency of 1 μ M CRF antagonist (compounds 3-14) to stimulate cAMP production in transfected HEK 293 cells (%IA, intrinsic activity) (A, B). Efficacy of CRF antagonists (c = 1 μ M for rCRFR1, and c = 10nM for mCRFR2 β) to inhibit cAMP production in transfected HEK 293 cells stimulated by 1nM oCRF (compound 1 for rCRFR1) and 1nM Svg (compound 2 for mCRFR2 β) (relative *in vitro* potency) (C, D). Data is the mean from 3-11 experiments. The error bars represent the SEM.

The examples illustrate the invention.

Example 1: Synthesis and analysis of peptides

Different truncated and conformationally constrained analogs of corticotropin-releasing factor (CRF) were synthesized on the basis of the amino acid sequences of human/rat CRF (h/rCRF), ovine CRF (oCRF), rat urocortin (rUcn), or sauvagine (Svg) (0.1 mmol scale) with Fmoc chemistry on TentaGel S RAM resin (Rapp, Tübingen, F.R.G.) with a model ABI 433A peptide synthesizer (Applied Biosystems). Comparison of the amino acid sequences of oCRF, rUcn and Svg with the sequence of h/rCRF reveals 45-83% amino acid identity. The CRF ligands mentioned share high amino acid identity at the N-terminus (47%) stretching from amino acid 2-20 (h/rCRF and oCRF) and 1-19 (rUcn and Svg), but little at the C-terminus (14%) of the peptides stretching from amino acid 21-41 and 20-40, respectively (Fig. 1). It was assumed that the ligand receptor interactions of the truncated forms of the CRF peptides ranging from amino acid 11-40 (rUcn and Svg) or 12-41 (h/rCRF and oCRF) acted differently than the full-length CRF peptides on CRFR1 or CRFR2 (Dautzenberg, F. M., K. Dietrich, M. R. Palchaudhuri, and J. Spiess, *J. Neurochem.* **69**:1640-1649, 1997; Vaughan, J., C. Donaldson, J. Bittencourt, M. H. Perrin, K. Lewis, S. Sutton, R. Chan, A. V. Turnbull, D. Lovejoy, C. Rivier, J. Rivier, P. E. Sawchenko, and W. Vale, *Nature (London)* **378**:287-292, 1995; Donaldson, C. J., S. W. Sutton, M. H. Perrin, A. Z. Corrigan, K. A. Lewis, J. E. Rivier, J. M. Vaughan, and W. W Vale, *Endocrinology* **137**:2167-2170, 1996; Gottowik, J., V. Goetschy, S. Henriot, E. Kitas, B. Fluhman, R. G. Clerc, J. L. Moreau, F. J. Monsma, and G. J. Kilpatrick, *Neuropharmacol.* **36**:1439-1446, 1997).

For the synthesis of the cyclized CRF analogs, astressin and cyclo(29-32)[DPhe¹¹, Glu²⁹, Lys³²]rUcn₍₁₁₋₄₀₎, the amino acid derivatives Fmoc-L-Glu(OAll)-OH and Fmoc-L-Lys(Alloc)-OH (PerSeptive Biosystems GmbH, Hamburg, F.R.G.) were used. The side-chain-protected peptides were reacted with Pd⁰[PPh₃]₄ in HOAc/N-methylaniline/dichloromethane (v/v; 2:1:40) for three hours and then cyclized with HOBt/HBTU in DMF and DIEA in NMP for eight hours. After removal of the N-terminal Fmoc group with piperidine in NMP, the peptides were cleaved from the resin under standard conditions. The crude peptides were purified by preparative reverse phase high-performance liquid chromatography (RP-HPLC) performed on a Waters Prep Nova-Pak HR C₁₈ silica gel column (5 x 30 cm, 6-μm particle size, 6-nm pore size) with a mixture of aqueous 0.1% trifluoroacetic acid and MeCN (see Table 5). The mass spectra of the purified peptides were measured with a plasma desorption mass

spectrometer (Biolon 20, Uppsala). Amino acid analysis (AAA) was performed after hydrolysis of peptides (6 N HCl, 3 hr, 150°C) with a Beckman High Performance Analyzer System 6300 (Beckman, San Remon).

Example 2: Binding of CRF agonists and antagonists to rCRFR1

CRF agonists and antagonists were tested in an *in vitro* assay for their ability to displace [125 I-Tyr 0]oCRF or [125 I-Tyr 0]Svg from membranes of HEK-rCRFR1 cells (Rühmann, A., A. K. E. Köpke, F. M. Dautzenberg, and J. Spiess, *Proc. Natl. Acad. Sci. USA* **93**:10609-10613, 1996) or HEK-mCRFR2 β cells (Kishimoto, T., R. V. Pearce II, C. R. Lin, and M. G. Rosenfeld, *Proc. Natl. Acad. Sci. USA* **92**:1108-1112, 1995). Binding assays were performed in 96-well MultiScreen plates (Millipore, Eschborn, Germany) with GF/B filters (pore size 1.0 μ m). Fifty-microliters of membrane suspension (25 μ g of protein from HEK-rCRFR1 cells; 50 μ g of protein from HEK-mCRFR2 β cells) was added to a plate containing CRF peptides ($c = 0$ -1 μ M) and 50,000 cpm of either [125 I-Tyr 0]oCRF (specific activity 81.4 TBq/mmol, 68.25 pM, DuPont NEN, Boston) for the analysis of rCRFR1 or [125 I-Tyr 0]Svg (specific activity 81.4 TBq/mmol, 68.25 pM, DuPont NEN, Boston) for the analysis of mCRFR2 β in 100 μ l incubation buffer (50 mM Tris/Cl, 5 mM MgCl $_2$, 2 mM EGTA, 100,000 kallikrein inhibitor units per liter of Trasylol (Bayer, Leverkusen), 1 mM dithiothreitol, 1 mg/ml BSA, pH 7.4). After incubation (60 min, 23°C), membrane suspension was aspirated through the plate, followed by two washes with assay buffer (0.2 ml, 23°). Radioactivity of the punched filters was measured with a 1470 WIZARD automatic gamma counter (Berthold, Hannover). Specific binding of [125 I-Tyr 0]oCRF or [125 I-Tyr 0]Svg to membranes of transfected cells was calculated by substraction of unspecific binding found in the presence of 1 μ M of nonlabeled ligand from total binding. Data analysis was achieved with the nonlinear curve fitting program LIGAND. Statistical analysis was performed with ANOVA, and significant differences between groups were determined by post hoc comparison using the Dunn test.

Example 3: Chemical cross-linking with [125 I-Tyr 0]oCRF or [125 I-Tyr 0]Svg

Chemical cross-linking was carried out in 1.5 ml polypropylene tubes (Sigma, Deisenhofen, Germany) as for the binding assay except that no BSA was used.

Samples (50 µg and 100 µg of protein from membrane fractions of HEK-rCRFR1 cells and HEK-mCRFR2β cells, respectively) were reacted with 10 µl of disuccinimidyl suberate (1.5 mM in dimethylsulfoxide, 23°C, 20 min) after incubation with ligand (V = 300 µl, 100,000 cpm, 1 hr, 23°C). The reaction was terminated by the addition of 1.0 ml of ice-cold buffer (10 mM Tris/Cl, 1 ml EDTA, pH 7.0, 4°C). In some experiments, the chemically cross-linked receptor was deglycosylated with PNGase (New England Biolabs, Schwalbach). Samples were then heated (100°C, 5 min) and subjected to SDS PAGE. Autoradiography was carried out on a BAS-IP NP 2040P imaging plate. Radioactivity was monitored with a Fujix BAS 2000 scanner (Raytest, Straubenhardt). Gel documentation was accomplished with the program TINA (Raytest).

Example 4: Determination of cAMP stimulation

HEK-rCRFR1 cells or HEK-mCRFR2β cells were incubated with different CRF agonists in the presence or absence of 1 µM or 10 nM antagonist, or CRF antagonist (c = 1 µM) alone. After removal of the medium, cells were lysed with aqueous 6% trichloroacetic acid (5 min, 100°C) (Rühmann, A., A. K. E. Köpke, F. M. Dautzenberg, and J. Spiess, *Proc. Natl. Acad. Sci. USA* **93**:10609-10613, 1996). The cell lysates were stored at -70°C until assayed with a RIA kit (Amersham, Little Chalfont). Data analysis was achieved with the sigmoidal dose-response curve fitting program ALLFIT. Statistical significance was determined across groups with ANOVA, and significant differences between groups were determined by post hoc comparison using the Dunn test.

Example 5: Displacement of [¹²⁵I-Tyr⁰]oCRF or [¹²⁵I-Tyr⁰]Svq from recombinant rCRFR1 or mCRFR2β by CRF analogs

Membrane homogenates of human embryonic kidney (HEK) 293 cells stably transfected with cDNA coding for rat CRF receptor, type 1 (rCRFR1) or mouse CRF receptor, type 2β (mCRFR2β) were prepared according to standard protocols (see, e.g., Sambrook et al., *Molecular Cloning: A Laboratory Manual*, 2nd. Edition, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1989; Ausubel et al., *Current Protocols in Molecular Biology*, Green Publishing Associates and Wiley Interscience, NY, 1989). The specific binding of [¹²⁵I-Tyr⁰]oCRF to membranes of HEK-rCRFR1 cells

was found to be 93% when the radioligand was displaced by oCRF. In analogous displacement experiments with Svg, the specific binding of [$^{125}\text{I-Tyr}^0$]Svg to membranes of HEK-mCRFR2 β cells was determined to be 94%. No specific binding of the two radioactively labeled CRF analogs to membranes of nontransfected HEK 293 cells could be observed. These data could be confirmed when [$^{125}\text{I-Tyr}^0$]oCRF and [$^{125}\text{I-Tyr}^0$]Svg were chemically cross-linked to rCRFR1 and mCRFR2 β , respectively. The molecular weight of both cross-linked receptors was 66,000. After deglycosylation with PNGase, molecular weights of 43,000 and 41,000 were found for crosslinked mCRF2 β and rCRFR1, respectively (Fig. 2), which are in agreement with the molecular weight predicted on the basis of DNA data (Perrin, M. H., C. J. Donaldson, R. Chen, K. A. Lewis, and W. Vale, *Endocrinology* 133:3058-3061, 1993; Kishimoto, T., R. V. Pearce II, C. R. Lin, and M. G. Rosenfeld, *Proc. Natl. Acad. Sci. USA* 92:1108-1112, 1995). The difference of 2,000 between the molecular weights of rCRFR1 and mCRFR2 β is probably due to the longer amino acid sequence of mCRFR2 β . No chemical cross-links could be observed with either radioligand to nontransfected HEK 293 cells.

As expected for the CRF peptide agonists (Dautzenberg, F. M., K. Dietrich, M. R. Palchaudhuri, and J. Spiess, *J. Neurochem.* 69:1640-1649, 1997; Donaldson, C. J., S. W. Sutton, M. H. Perrin, A. Z. Corrigan, K. A. Lewis, J. E. Rivier, J. M. Vaughan, and W. W. Vale, *Endocrinology* 137:2167-2170, 1996; Gottowik, J., V. Goetschy, S. Henriot, E. Kitas, B. Fluhman, R. G. Clerc, J. L. Moreau, F. J. Monsma, and G. J. Kilpatrick, *Neuropharmacol.* 36:1439-1446, 1997), oCRF and Svg exhibited similar high-affinity binding to rCRFR1 (oCRF: $K_d = 0.6 \pm 0.1$ nM, Svg: $K_d = 0.7 \pm 0.1$ nM), but differed significantly in their binding to mCRFR2 β (oCRF: $K_d = 162.4 \pm 37.6$ nM, Svg: $K_d = 4.5 \pm 0.6$ nM) (Table 1, Fig. 3).

For the binding of the CRF antagonists, (α -helical CRF $_{(9-41)}$ and [DPhe 12 , Nle 21,38]h/rCRF $_{(12-41)}$ described earlier (Gulyas, J., C. Rivier, M. Perrin, S. C. Koerber, S. Sutton, A. Corrigan, S. L. Lahrachi, A. G. Craig, W. Vale, and J. Rivier, *Proc. Natl. Acad. Sci. USA* 92:10575-10579, 1995) to rCRFR1, K_d values of 60.3 ± 10.6 nM and 46.4 ± 9.4 nM were obtained, respectively. The antagonist astressin (Gulyas, J., C. Rivier, M. Perrin, S. C. Koerber, S. Sutton, A. Corrigan, S. L. Lahrachi, A. G. Craig, W.

Vale, and J. Rivier, *Proc. Natl. Acad. Sci. USA* **92**:10575-10579, 1995), cyclo(30-33)[DPhe¹², Nle^{21,38}, Glu³⁰, Lys³³]h/rCRF₍₁₂₋₄₁₎, was found to bind nonselectively with similar affinity to rCRFR1 ($K_d = 5.7 \pm 1.6$ nM) and mCRFR2 β ($K_d = 4.0 \pm 2.3$ nM), whereas α -helical CRF₍₉₋₄₁₎ and [DPhe¹², Nle^{21,38}]h/rCRF₍₁₂₋₄₁₎ showed moderate selectivity for binding to mCRFR2 β with K_d values of 6.4 ± 0.9 nM and 17.7 ± 2.2 nM, respectively (Table 1). [DPhe¹²]oCRF₍₁₂₋₄₁₎ based on the amino acid sequence of oCRF showed low-affinity binding to rCRFR1 and mCRFR2 β with K_d values of 290.2 ± 74.7 nM and 153.8 ± 26.8 nM, respectively (Table 1, Fig. 3).

The truncated Ucn analogs [DPhe¹¹]rUcn₍₁₁₋₄₀₎, [DPhe¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎, [DLeu¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎, and cyclo(29-32)[DPhe¹¹, Glu²⁹, Lys³²]rUcn₍₁₁₋₄₀₎ exhibited moderate binding affinity to rCRFR1 with K_d values of 33.0 ± 5.9 nM, 68.2 ± 20.5 nM, 91.1 ± 21.2 nM, and 47.1 ± 8.9 nM, respectively, and revealed little preference for binding to mCRFR2 β with K_d values of 5.2 ± 1.5 nM, 9.5 ± 2.0 nM, 27.9 ± 3.4 nM, and 22.4 ± 4.6 nM, respectively (Table 1, Fig. 3).

The Svg-derived peptides [DLeu¹¹]Svg₍₁₁₋₄₀₎, Svg₍₁₁₋₄₀₎, [DPhe¹¹]Svg₍₁₁₋₄₀₎, and [DPhe¹¹, His¹²]Svg₍₁₁₋₄₀₎ showed low-affinity binding to rCRFR1 with K_d values of 1670.0 ± 500.0 nM, 831.2 ± 668.8 nM, 237.3 ± 27.7 nM, and 153.6 ± 33.5 nM, respectively, but high-affinity binding to mCRFR2 β with K_d values of 20.9 ± 4.1 nM, 15.4 ± 2.5 nM, 3.5 ± 0.2 nM, and 1.4 ± 0.4 nM, respectively (Table 1). Thus, [DPhe¹¹, His¹²]Svg₍₁₁₋₄₀₎, [DLeu¹¹]Svg₍₁₁₋₄₀₎, [DPhe¹¹]Svg₍₁₁₋₄₀₎, and Svg₍₁₁₋₄₀₎ bound with a 77-, 56-, 47-, and 38-fold higher selectivity to mCRFR2 β than astressin, respectively.

ANOVA indicated statistically significant differences in high-affinity binding, $F(13,41) = 13.17$ $p = 0.0001$, of the CRF peptides (compounds 1-14) to cell membranes of HEK-rCRFR1 cells (Table 1). Post hoc comparison demonstrated a significantly lower binding affinity of [DLeu¹¹]Svg₍₁₁₋₄₀₎ (compound 13) and Svg₍₁₁₋₄₀₎ (compound 14) to cell membranes when compared to compounds 1-5, and 7-11 ($p = 0.0001$) (Table 1). Statistically significant differences in high-affinity binding, $F(13,36) = 20.34$ $p = 0.0001$, of oCRF (compound 1) and [DPhe¹²]oCRF₍₁₂₋₄₁₎ (compound 6) to cell membranes of HEK-mCRFR2 β cells were observed. Post hoc

comparison demonstrated a significantly lower binding affinity of oCRF (compound 1) and [DPhe¹²]oCRF₍₁₂₋₄₁₎ (compound 6) to cell membranes when compared to compounds 2-5 and compounds 7-14 ($p = 0.0001$) (Table 1).

Thus, in comparison to astressin, the most potent CRF antagonist described to date (Gulyas, J., C. Rivier, M. Perrin, S. C. Koerber, S. Sutton, A. Corrigan, S. L. Lahrichi, A. G. Craig, W. Vale, and J. Rivier, *Proc. Natl. Acad. Sci. USA* **92**:10575-10579, 1995), the intrinsic activity of [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ was not significantly different in experiments with HEK-rCRFR1 or HEK-mCRFR2 β cells. However, the inhibitory potency of [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ towards rCRFR1 was found to be 15% of the potency of astressin. This difference was determined to be significant. In contrast, no significant difference between the inhibitory potencies of astressin and [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ was observed, when HEK-mCRFR2 β cells were tested (Table 2). The difference between astressin and [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ was even more pronounced in binding experiments (Table 1) which demonstrated that [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ exhibited in contrast to astressin selective binding to mCRFR2 β . On the basis of ligand comparisons, [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ was thus demonstrated to be a selective, mCRFR2 β -directed CRF antagonist with low intrinsic activities directed towards rCRFR1 and mCRFR2 β .

In contrast to CRFR2, mammalian CRFR1 has been reported to be nonselective for CRF and CRF-like peptides including the structurally related 40-amino acid peptides Svg and Ucn (Vita, N., P. Laurent, S. Lefort, P. Chalon, J.-M. Lelias, M. Kaghad, G. Le Fur, D. Caput, and P. Ferrara, *FEBS Lett.* **335**:1-5, 1993; Dautzenberg, F. M., K. Dietrich, M. R. Palchaudhuri, and J. Spiess, *J. Neurochem.* **69**:1640-1649, 1997; Vaughan, J., C. Donaldson, J. Bittencourt, M. H. Perrin, K. Lewis, S. Sutton, R. Chan, A. V. Turnbull, D. Lovejoy, C. Rivier, J. Rivier, P. E. Sawchenko, and W. Vale, *Nature (London)* **378**:287-292, 1995; Fisher, L., C. Rivier, J. Rivier, and M. Brown, *Endocrinology* **129**:1312-1316, 1991; Donaldson, C. J., S. W. Sutton, M. H. Perrin, A. Z. Corrigan, K. A. Lewis, J. E. Rivier, J. M. Vaughan, and W. W. Vale, *Endocrinology* **137**:2167-2170, 1996). Experimental data available thus far do not show significant pharmacological differences between mammalian CRFR2 α and CRFR2 β (Fisher, L., C. Rivier, J. Rivier, and M. Brown, *Endocrinology* **129**:1312-1316, 1991; Donaldson, C.

J., S. W. Sutton, M. H. Perrin, A. Z. Corrigan, K. A. Lewis, J. E. Rivier, J. M. Vaughan, and W. W. Vale, *Endocrinology* **137**:2167-2170, 1996). On this basis, it is expected that [DPhe¹¹, His¹²]Sv_{g(11-40)} inhibits CRFR2 α similarly as CRFR2 β . Indeed, results obtained from in vivo experiments with BALB/c mice showed that [DPhe¹¹, His¹²]Sv_{g(11-40)} inhibited CRF-mediated behavioral effects in the lateral septum (J. Radulovic, A. Rühmann, T. Liepold and J. Spiess, *J. Neurosci.* **19** (1999), 5016-5025; D.T. Chalmers, T.W. Lovenberg and E. B. DeSouza, *J. Neurosci.* **15** (1995), 6340-6350) an area in the brain which exclusively expresses CRF2 α -mRNA.

Example 6: cAMP stimulation

The peptide agonists oCRF and Svg exhibited high potency to increase cAMP accumulation in HEK-rCRFR1 cells with EC₅₀ values of 0.41 ± 0.08 nM and 0.19 ± 0.05 nM, respectively, but differed significantly in their potencies to stimulate cAMP production in HEK-mCRFR2 β cells with EC₅₀ values of 11.79 ± 1.96 nM and 0.23 ± 0.05 nM, respectively.

The CRF antagonists (compounds 3-14, Table 2, Fig. 4) mentioned above were tested for their ability to enhance or inhibit oCRF- and Svg-stimulated cAMP production in transfected HEK 293 cells expressing rCRFR1 (HEK-rCRFR1 cells) and mCRFR2 β (HEK-mCRFR2 β cells), respectively. Intrinsic activities were measured at peptide concentrations generating maximal formation of cAMP in HEK-rCRFR1 or HEK-mCRFR2 β cells. The intrinsic activities of CRF antagonists tested by their effect at a concentration of 1 μ M on HEK-rCRFR1 cells ranged from 4-23% of the intrinsic activity of oCRF (compound 1) tested at a concentration of 1 nM. The intrinsic activities of the antagonists tested under equivalent conditions with HEK-mCRFR2 β cells were 0.4-0.9% of the intrinsic activity of Svg (compound 2) (Table 2, Fig. 4).

ANOVA indicated statistically significant differences in intrinsic activity, $F(12,50) = 11.68$, $p = 0.0001$, of compounds 3-14 to stimulate cAMP production in HEK-rCRFR1 cells. Post hoc comparison demonstrated a significantly higher intrinsic activity of compounds 8, 9, and 13 when compared to compounds 5, 6, 7, 11, and 12 ($p = 0.001$). Compounds 4 and 14 also significantly increased cAMP production in HEK-rCRFR1 cells when compared to the basal level of cAMP in the same cells ($p = 0.001$) (Table 2). ANOVA indicated no statistically significant differences in

intrinsic activity of compounds 3-14 to stimulate cAMP production in HEK-mCRFR2 β cells. Compound 11 exhibited the lowest intrinsic activity of all tested CRF antagonists in experiments with either recombinant system, HEK-rCRFR1 cells and HEK-mCRFR2 β cells (Table 2).

The rank order of potencies for the CRF related peptide antagonists to suppress oCRF-induced cAMP-accumulation in HEK-rCRFR1 cells was as follows: astressin (compound 3) and [DPhe¹¹]rUcn₍₁₁₋₄₀₎ (compound 7) > [DPhe¹², Nle^{21,38}]h/rCRF₍₁₂₋₄₁₎ (compound 5) and [DPhe¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎ (compound 8) > [DLeu¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎ (compound 9) and α -helical CRF₍₉₋₄₁₎ (compound 4) > [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ (compound 11), [DPhe¹¹]Sv₍₁₁₋₄₀₎ (compound 12), Sv₍₁₁₋₄₀₎ (compound 14), and cyclo(29-32)[DPhe¹¹, Glu²⁹, Lys³²]rUcn₍₁₁₋₄₀₎ (compound 10) > [DPhe¹²]oCRF₍₁₂₋₄₁₎ (compound 6) and [DLeu¹¹]Sv₍₁₁₋₄₀₎ (compound 13). In contrast, the following pharmacological profile was obtained for the inhibition of Svg-stimulated cAMP production in HEK-mCRFR2 β cells by CRF antagonists: [DPhe¹¹, His¹²]Sv₍₁₁₋₄₀₎ (compound 11) > astressin (compound 3), [DPhe¹¹]rUcn₍₁₁₋₄₀₎ (compound 7), [DPhe¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎ (compound 8), and α -helical CRF₍₉₋₄₁₎ (compound 4) > [DPhe¹¹]Sv₍₁₁₋₄₀₎ (compound 12), [DLeu¹¹]Sv₍₁₁₋₄₀₎ (compound 13), and Sv₍₁₁₋₄₀₎ (compound 14) > [DLeu¹¹, Glu¹²]rUcn₍₁₁₋₄₀₎ (compound 9) > [DPhe¹², Nle^{21,38}]h/rCRF₍₁₂₋₄₁₎ (compound 5), cyclo(29-32)[DPhe¹¹, Glu²⁹, Lys³²]rUcn₍₁₁₋₄₀₎ (compound 10), and [DPhe¹²]oCRF₍₁₂₋₄₁₎ (compound 6).

ANOVA indicated statistically significant differences in potency, $F(12,39) = 7.93$, $p = 0.0001$, of compounds 3-14 to inhibit oCRF-stimulated cAMP production in HEK-rCRFR1 cells. Post hoc comparison demonstrated a significantly higher potency of compounds 3 and 7 when compared to compounds 6 ($p = 0.0001$) and compounds 10-14 ($p = 0.0001$). A significantly higher potency was also observed for compound 5 when compared to compounds 6 ($p = 0.001$) and 13 ($p = 0.0001$).

ANOVA indicated statistically significant differences in potency, $F(12,65) = 6.34$, $p = 0.0001$, of compounds 3-14 to inhibit Svg-stimulated cAMP production in HEK-mCRFR2 β cells. Post hoc comparison demonstrated a significantly higher potency of compound 11 when compared to compounds 2 and 4 ($p = 0.001$) or compounds 5, 6,

9, 10, and 13 ($p = 0.0001$).

Example 7: Synthesis of 4-(1-azi-2,2,2-trifluoroethyl)benzoic acid

4-(1-azi-2,2,2-trifluoroethyl)benzoic acid was synthesized as described in PCT/EP96/05011.

Example 8: Analysis of CRFR2-selective antagonists suitable for radioactive labelling and photoaffinity labelling experiments

Corticotropin-releasing factor (CRF) receptor, type 2 β (CRFR2 β)-selective antagonists based on the truncated amino acid sequence of sauvagine (Svg) were synthesized and characterized. The N-terminal amino acid Leu¹¹ in Svg (11-40) was substituted by either tyrosine or a phenyldiazirine, the 4-(1-azi-2,2,2-trifluoroethyl)benzoyl (ATB) group, for radioactive labelling or photoaffinity labelling experiments, respectively. To further increase the binding affinity of the ligands to membrane homogenates of human embryonic kidney (HEK) cells permanently transfected with cDNA coding for rat CRFR1 (rCRFR1) or mouse CRFR2 β (mCRFR2 β), Glu¹² was substituted by histidine.

The binding affinity of the compounds to rCRFR1 and mCRFR2 β and the potency of the ligands to produce cAMP accumulation (agonistic activity) or inhibit oCRF-(rCRFR1) or Svg-(mCRFR2 β) stimulated cAMP production (antagonistic activity) in transfected cells were compared with the binding affinity and potency of antisauvagine-30 {[DPhe¹¹, His¹²]Svg(11-40)} (compound 11), astressin {cyclo(30-33)[DPhe¹², Nle^{21,38}, Glu³⁰, Lys³³]h/rCRF(12-41)} (compound 3) and the photoactivatable astressin analogs ATB-cyclo(30-33)[Nle^{21,38}, Glu³⁰, Ala³², Lys³³]h/rCRF(13-41) (compound 15) and ATB-cyclo(30-33)[Nle^{21,38}, Glu³⁰, Tyr³², Lys³³]h/rCRF(13-41) (compound 16).

Substitution of DPhe¹¹ by the phenyldiazirine moiety in ATB-[His¹²]Svg(12-40) (compound 17) did not significantly change the binding affinity, ligand selectivity, and potency of this ligand to CRFR1 and mCRFR2 β when compared with antisauvagine-30 (compound 11) (Table 3 and 4). Similar results could be observed for ATB-cyclo(30-33)[(Nle^{21,38}, Glu³⁰, Ala³², Lys³³]h/rCRF(13-41) (compound 15) when compared with astressin (compound 3) (Table 3 and 4).

Substitution of DPhe¹¹ by tyrosine in [Tyr¹¹, His¹²]Svg(11-40) (compound 18) or

[Tyr¹¹]Svg(11-40) (compound 19) decreased the binding affinity of these compounds to rCRFR1 or mCRFR2 β by 1.4 to 5.9-fold when compared to antisauvagine-30 (compound 11) or [DPhe¹¹]Svg(11-40) (compound 12), respectively, without changing preferable binding to mCRFR2 β . Further N-terminal truncation of the amino acid sequence Svg(11-40) by one amino acid and substitution of Glu¹² by tyrosine completely abolished high-affinity binding of [Tyr¹²]Svg(12-40) (compound 20) to mCRFR2 β (Table 3).

TABLE 1

Binding constants (K_d , [nM]) found for different CRF-related agonists and antagonists when bound to recombinant rCRFR1 with [125 I-Tyr 0]oCRF as competitive ligand or recombinant mCRFR2 β with [125 I-Tyr 0]SvG as competitive ligand.

No.	peptides	[125 I-Tyr 0]oCRF K_d (rCRFR1), [nM]	[125 I-Tyr 0]SvG K_d (mCRFR2 β), [nM]	P	Selectivity ^e

^a, Percent purity determined by RPHPLC using solvent system: A = 0.1% TFA in water, B = 80% MeCN in 0.1% TFA in water. ^b, The retention time (R_t) of the compounds was determined by RPHPLC. Samples were eluted with 5% B for 5 min and then with a linear gradient of 5-95% B in 30 min. ^c, The observed *m/z* of the average compared with the calculated [M+H]⁺ + average mass.

[illegible]

Claims

1. An antagonist of the ligand of the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 8 to 10 N-terminal amino acids of native sauvagine.
2. The antagonist of claim 1 lacking the 10 N-terminal amino acids of native sauvagine.
3. The antagonist of claim 2 comprising the amino acid sequence Xaa₁-Xaa₂-Leu-Leu-Arg-Lys-Met-Ile-Glu-Ile-Glu-Lys-Gln-Glu-Lys-Glu-Lys-Gln-Gln-Ala-Ala-Asn-Asn-Arg-Leu-Leu-Leu-Asp-Thr-Ile-NH₂, wherein Xaa₁ is a neutral amino acid, and Xaa₂ is a charged amino acid.
4. The antagonist of claim 3, wherein Xaa₁ is a hydrophobic amino acid, and Xaa₂ is Glu or His.
5. The antagonist of claim 4, wherein Xaa₁ is Leu.
6. The antagonist of claim 3, wherein Xaa₁ is a polar amino acid, and Xaa₂ is Glu or His.
7. The antagonist of claim 6, wherein Xaa₁ is Tyr.
8. The antagonist of any one of claims 3, 4 or 6, wherein Xaa₁ is in the D-configuration.
9. The antagonist of claim 8, wherein Xaa₁ is D-Leu.
10. The antagonist of claim 8, wherein Xaa₁ is D-Tyr.
11. The antagonist of any one of claim 5, 7, 9 or 10, wherein Xaa₂ is Glu.

12. The antagonist of claim 8, wherein Xaa₁ is D-Phe.
13. The antagonist of any one of claims 7, 10 or 12, wherein Xaa₂ is His.
14. An antagonist of the ligand of the Corticotropin-Releasing Factor Receptor, type 2 (CRFR2) lacking the 11 N-terminal amino acid of native sauvagine, wherein the N-terminal amino acid of said antagonist is a charged amino acid.
15. The antagonist of claim 14, wherein said charged amino acid is positively charged.
16. The antagonist of claim 15, wherein said charged amino acid is His.
17. The antagonist of any one of claims 14 to 16 which comprises a phenyldiazirine group coupled to the N-terminal amino acid of said antagonist.
18. The antagonist of claim 17, wherein said phenyldiazirine group is a 4-(1-aziridin-2,2,2-trifluoroethyl)benzoyl (ATB)-group.
19. A polynucleotide encoding the antagonist of any one of claims 1 to 7, 11, 13 or 14 to 16.
20. A vector comprising the polynucleotide of claim 19.
21. The vector of claim 20, wherein said polynucleotide is operatively linked to an expression control sequence.
22. A host comprising the polynucleotide of claim 19 or vector of claim 20 or 21.
23. A method for producing the antagonist of any one of claims 1 to 7, 11, 13, or 14 to 16, said method comprising culturing the host of claim 22 under conditions that cause the synthesis of said antagonist, and recovering said antagonist from the culture.

24. An antagonist obtainable by the method of claim 23.
25. An antibody directed against the antagonist of any one of claims 1 to 18, or 24.
26. An anti-idiotypic antibody directed against the antibody of claim 25.
27. A pharmaceutical composition comprising the antagonist of any one of claims 1 to 18, or 24, the polynucleotide of claim 19, the vector of claim 20 or 21, the antibody of claim 25 and/or the anti-idiotypic antibody of claim 26 and optionally a pharmaceutically acceptable carrier and/or diluent.
28. A diagnostic composition comprising the antagonist of any one of claims 1 to 18, or 24, the polynucleotide of claim 15, the vector of claim 20 or 21, the antibody of claim 45 and/or the anti-idiotypic antibody of claim 26.
29. A kit comprising
- (a) an antagonist of any one of claims 1 to 18, or 24;
 - (b) the polynucleotide of claim 19;
 - (c) the vector of claim 20 or 21;
 - (d) the antibody of claim 25; and/or
 - (e) the anti-idiotypic antibody of claim 26.
30. Use of the antagonist of any one of claims 1 to 18, or 24, the polynucleotide of claim 19, the vector of claim 20 or 21, the antibody of claim 25 and/or the anti-idiotypic antibody of claim 26 for the preparation of a pharmaceutical composition for preventing and/or treating a Corticotropin-Releasing Factor Receptor, type 2 (CRFR2)-associated disease.
31. The antagonist of any one of claims 1 to 18, or 24, or the use of claim 30, wherein said CRFR2 is CRFR2 α or CRFR2 β .
32. The use of claim 30 or 31 for preventing and/or treating affective disorders,

gastric intestinal diseases, cardiopathic diseases, psychiatric diseases, preferably eating disorders, anxiety disorders or anorexia nervosa, and/or Alzheimer's disease.

33. Use of the antagonist of any one of claims 1 to 18, or 24, the polynucleotide of claim 19, the vector of claim 20 or 21, the antibody of claim 25 and/or the anti-idiotypic antibody of claim 26 for the investigation of CRF receptor type-specific functions.
